

- 6a. Write 4 equations, for **incomplete combustion** (to  $\text{CO} + \text{H}_2\text{O}$ ) and **complete combustion** ( $\text{CO}_2 + \text{H}_2\text{O}$ ) for butane & butene.
- 6b. 43.8 g of butane produces \_\_\_\_\_ g of CO with incomplete combustion, and \_\_\_\_\_ g of  $\text{CO}_2$  with complete combustion; 43.8 lb of butene produces \_\_\_\_\_ lb of CO with incomplete combustion, and \_\_\_\_\_ lb of  $\text{CO}_2$  with complete combustion.
7. What is the name, formula, and molar mass of the **alkanes** with 1-8 carbons? the 7 smallest **alkenes** and **alkynes** (how many C's do they have) with only one C=C or triple bond?

8a. Draw isomers for **alkanes** with 1-6 carbons & (optional) 7-8. The number of isomers for  $\text{CH}_4$  and  $\text{C}_2\text{H}_6$  and  $\text{C}_3\text{H}_8$  is only 1;  $\text{C}_4\text{H}_{10}$  has 2 isomers, and  $\text{C}_5\text{H}_{12}$  has 3;  $\text{C}_6\text{H}_{14}$  has 5 isomers, with table-columns (2345678) giving hints for what they are (1 with longest chain of 6 Cs, 2 where longest chain is 5 Cs, and 2 with longest chain of 4 Cs); if you want a challenge,  $\text{C}_7\text{H}_{16}$  has 9 isomers (1, 2, 5, and 1 for chains with lengths of 7, 6, 5, and 4);  $\text{C}_8\text{H}_{18}$  has 18 isomers (1, 3, 7, 6, 1 for chains with longest lengths of 8, 7, 6, 5, and 4 carbons), <http://www.kentchemistry.com/links/organic/isomersofalkanes.htm>

alkanes	#	longest chain	2	3	4	5	6	7	8
$\text{C}_3\text{H}_8$	1		0	1	-	-	-	-	-
$\text{C}_4\text{H}_{10}$	2		0	1	1	-	-	-	-
$\text{C}_5\text{H}_{12}$	3		0	0	2	1	-	-	-
$\text{C}_6\text{H}_{14}$	5		0	0	2	2	1	-	-
$\text{C}_7\text{H}_{16}$	9		0	0	1	5	2	1	-
$\text{C}_8\text{H}_{18}$	18		0	0	1	6	7	3	1

8b. Draw isomers for **alkenes** with 2-5 carbons & (optional) 6-7.  $\text{C}_2\text{H}_4$  and  $\text{C}_3\text{H}_6$  have 1 isomer,  $\text{C}_4\text{H}_8$  has 3;  $\text{C}_5\text{H}_{10}$  has 5 (2 and 3 for C-chains with lengths of 5 and 4). With **cyclo-isomers**,  $\text{C}_3\text{H}_6$  and  $\text{C}_4\text{H}_8$  and  $\text{C}_5\text{H}_{10}$  have 1, 2, and 4 more isomers, respectively.

alkenes	#	cyclo	2	3	4	5	6	7
$\text{C}_3\text{H}_6$	1	+1	0	1	-	-	-	-
$\text{C}_4\text{H}_8$	3	+2	0	1	2	-	-	-
$\text{C}_5\text{H}_{10}$	5	+4	0	0	0	3	2	-
$\text{C}_6\text{H}_{12}$	13	+7	0	0	1	2	3	4
$\text{C}_7\text{H}_{14}$	27	+11	0	0	1	1	2	2

**USEFUL:** Chlorine: A **chlorine atom** has 7 valence electrons, so it is a neutral free radical (because with an odd number it MUST have an unpaired electron) without an octet, and it's very reactive, as in its reaction that begins the ozone-depleting reaction cycle. / A **chlorine molecule**,  $\text{Cl}_2$ , is neutral, has two octets, no unpaired electrons (has unshared non-bonding els); is stable by itself but can be split by visible light, often reacts with other chemicals. / A **chloride ion** has charge of -1, and 8 valence electrons (octet); usually it's chemically stable, unreactive with other chemicals.

In the Periodic Table, notice that Cl has two numbers: **17** (its **atomic number**) shows that every Cl has 17 protons; **35.45** (its **molar mass**) shows that 1 mole of "natural Cl" is 35.45 grams.

3a: (1 gal) (3785 mL/gal) (.70 g  $\text{C}_8\text{H}_{18}$  / mL  $\text{C}_8\text{H}_{18}$ ) (1 mol  $\text{C}_6\text{H}_{18}$  / 114 g  $\text{C}_8\text{H}_{18}$ ) (8 mol  $\text{CO}_2$  / 1 mol  $\text{C}_8\text{H}_{18}$ ) (44 g  $\text{CO}_2$  / 1 mol  $\text{CO}_2$ ) (1 lb / 454 g)

**ENERGY BALANCES:** changed by enhanced greenhouse effect? **incoming E = outgoing E** is needed for steady state with constant temperature; transient-radiation (100 = 6 + 25 + 46 + 23) and ultimate-radiation (100 = 6 + 25 + 60 + 9), **atmosphere** (23 + 37 = 60), **earth** (46 = 37 + 9). Figure 3.2 is simplified, so it doesn't show some complex interactions; for example, "much of this heat is redirected and comes back..." (CiC, pg 103) Sun's EM radiation (UV, visible, infrared) differs (re: transmission, reflection, absorption, emission) as explained in CiC, shown by yellow, blue, red.

\* of 46% out, 9% transmits (mic space) 37% absorbed (trapped) 46% total = .80 (≡ normal non-enhanced GH Effect due to "return") is good, helps keep earth's temp comfy for LIFE

**ENHANCED GH Effect if >.80**

**OPTIONAL:** Chlorine has two main isotopes: 76% is  $^{35}\text{Cl}$  (34.97 g/mole) with 18 neutrons, 24% is  $^{37}\text{Cl}$  (36.97 g/mole) with 20 neutrons; a **weighted average** of this **naturally occurring mixture of isotopes** is 35.45 g/mol. Using math intuition for a **weighted average**, does it make sense that 35.45 is closer to 35 than 37? There is no Cl-isotope with molar mass = 35.45, but 1 mole of "naturally occurring" Cl atoms will have mass of 35.45 g.

This skill may be useful elsewhere, but for 108-exams you won't need to calculate a weighted average:  $.76(34.97) + .24(36.97) = 35.45$

• answers for assigned problems in CiC, p 146-7: **40a** (1 3 2 3), **40b** (2), **40c** (30); **41c** (6 vs 8); **45** [(73 mt  $\text{CH}_4$ ] [12 mt C / 16  $\text{CH}_4$ ] = 55 mt C); and online - **1b** (.43g  $\text{NaHCO}_3 \rightarrow .18\text{g } \text{CO}_2$ ), **3e** (1600g, 1875 mL)

**ANSWERS for Problems — 4, 7, 6a-6b, 5a-5b-5c:**

4. 64 g (1/32) = 2 mole of  $\text{O}_2$ , 64 g (1/2) = 32 mole of  $\text{H}_2$ . diatomics: Hydrogen ( $\text{H}_2$ ), Air ( $\text{N}_2 \text{O}_2$ ), Halogens ( $\text{F}_2 \text{Cl}_2 \text{Br}_2 \text{I}_2$ ) **5-6** are below.

7. mother eats peanut butter (methane ethane propane butane), pentane hexane heptane octane; the number of C-and-H is  $\text{C}_n\text{H}_{2n+2}$  so it's  $\text{CH}_4 \text{C}_2\text{H}_6 \text{C}_3\text{H}_8 \text{C}_4\text{H}_{10} \text{C}_5\text{H}_{12} \text{C}_6\text{H}_{14} \text{C}_7\text{H}_{16} \text{C}_8\text{H}_{18}$ ; molar masses: 16 30 44 58 72 86 100 114

**alkenes:** names are like alkanes but with "ane" replaced by "ene": ~~methene~~ ethene propene butene pentene...; if one C=C it loses 2 Hs; to see why, draw an alkane, then convert one C-C into C=C and (oops) two C's now have 5 bonds, so (because C wants 4 bonds) you must remove one H from each C, thus the loss of 2 H's; now convert an alkane into a cycloalkane, and you'll also see a loss of 2 H; for each, H's go from  $2n+2$  to  $2n$ , and with  $\text{C}_n\text{H}_{2n}$  it's  $\text{C}_2\text{H}_4 \text{C}_3\text{H}_6 \text{C}_4\text{H}_8 \text{C}_5\text{H}_{10} \text{C}_6\text{H}_{12} \text{C}_7\text{H}_{14} \text{C}_8\text{H}_{16}$  and molar masses are 28 42 56 70 84 98 112 names: ~~methene~~ ethene propene butene pentene hexene...

**alkynes:** ethyne propyne etc; formula is  $\text{C}_n\text{H}_{2n-2}$  (losing two more Hs; why?) -  $\text{C}_2\text{H}_2 \text{C}_3\text{H}_4 \text{C}_4\text{H}_6 \text{C}_5\text{H}_8 \text{C}_6\text{H}_{10} \text{C}_7\text{H}_{12} \text{C}_8\text{H}_{14}$  molar masses: 26 40 54 68 82 96 110

6a. butane incomplete:  $2 \text{C}_4\text{H}_{10} + 9 \text{O}_2 \rightarrow 8 \text{CO} + 10 \text{H}_2\text{O}$   
butane complete:  $2 \text{C}_4\text{H}_{10} + 13 \text{O}_2 \rightarrow 8 \text{CO}_2 + 10 \text{H}_2\text{O}$   
butene incomplete:  $2 \text{C}_4\text{H}_8 + 8 \text{O}_2 \rightarrow 8 \text{CO} + 8 \text{H}_2\text{O}$   
butene complete:  $2 \text{C}_4\text{H}_8 + 12 \text{O}_2 \rightarrow 8 \text{CO}_2 + 8 \text{H}_2\text{O}$

note: Cutting coefficient-#s in half is ok if they represent moles (... + 4.5 mol  $\text{O}_2$  ...) not molecules. Compared with incomplete combustion for 1 mole of  $\text{C}_4\text{H}_{10}$  (or  $\text{C}_4\text{H}_8$ ), why is 2 more moles  $\text{O}_2$  required for complete combustion? Why is 1 mole less  $\text{H}_2\text{O}$  produced per mole of butene, compared with butane? Do these differences (a. 2 more moles  $\text{O}_2$ , b. 1 less mole  $\text{H}_2$ ) change if the hydrocarbon changes from  $\text{C}_4$  to  $\text{C}_8$ ? (a changes, b is same)

6b.  $\text{C}_4\text{H}_{10}$  (84.6g CO, 133g  $\text{CO}_2$ );  $\text{C}_4\text{H}_8$  (87.6 lb CO, 138 lb  $\text{CO}_2$ )

5a. 234 mL (.70 g / 1 mL) = 164 g  
5b. 164 g (1 mL / .70 g) = 234 mL  
5c. (134 g / 234 mL) = .701 g/mL

**ENERGY BALANCES (CiC pg 103)**
